Methodological advances in biological anthropology by 3D imaging

Hélène Coqueugniot

Directeur de Recherche, CNRS, Directeur d'Études Cumulant, EPHE, Associate Researcher, Dept of Human Evolution, Max Planck Institute Leipzig

Abstract

3D imaging has become an essential tool in the field of biological anthropology, notably for human evolution purposes. High resolution virtual 3D reconstructions of original specimens contribute to their preservation and broaden the ability for research, teaching and exchanges. The 3D methodology can help to improve our knowledge of natural history and evolution of ancient human diseases (Coqueugniot et al., 2015).
